- The NetDispenser is an inexpensive Raspberry-Pi computer, configured as a WiFi Hotspot and credit-meter, which grants internet access in exchange for earned credits.
- Credits are awarded by completing educational activities at the creditfeeder website, which is always accessible.
- 3. Earned credits are transferred from the credit-feeder website back to the credit-meter device simply by clicking a button on the webpage broadcast by the device.
- A second button starts the creditmeter and grants full internet access to all of the child's devices.
- When the credits run out it's back to the credit-feeder to earn more credits.
- Because the credit-feeder website is online, parents can configure assignments and queue them from anywhere.
- 7. The device is easily turned "on" when it's needed, and "off" when it's not. The intent is not to restrict access to information. Rather, it is a tool for parents to help them prepare their children for the future.

Testimonials

I know that my kids are at home reading the assignments which I made for them while I was at work.

I used to beg them, now I just make them. I highly recommend the NetDispenser!

I don't like it. I can feel myself learning and it hurts. But I do what I must in order to do what I wantl

Mom, can you make me read some more about becoming a doctor?
